Description

Hi,

The Wiki extension plugin you wrote is awesome!

I wonder if it's possible to suggest a new feature to the plugin that I find very usefull.

This new feature would make it possible to include files from the repository as the content of a wiki page.

This is particularly important when we want to document the software using wiki format.

As my English is not very good I believe that an example would be better.

Imagine that I write a text file called vision.wiki and the text inside this file is in wiki format.

Then, I send this file to the repository folder: trunk/design/requirement/vision.wiki

Now, I create a new wiki page in Redmine called Vision. Instead of writing a regular wiki text inside this new wiki page I just place a macro pointing to the vision.wiki file in the repository. So mething like this:

```
{{include:repo/trunk/design/requirement/vision.wiki}}
```

That would be great!
